1.0	12 July 2026	Dibyendu Dey (Product Manager)	Rajiv Papneja (CTO)	Initial draft covering the six core capabilities

How to Read This Guide

Each capability of AgentHub has a dedicated chapter. Within each chapter, every feature is described with its purpose, how it is used, and its current availability. Dashed boxes are placeholders where product screenshots will be inserted. Availability tags indicate whether a feature is Available Now, Partially Available, or On Roadmap.

1. Introduction

1.1 What is AgentHub

AgentHub is a design and governance plane for enterprise-scale AI agents. It provides a single source of truth where agents and agentic workflows are discovered, defined, versioned, governed, built, tested, and deployed across heterogeneous platforms. AgentHub is deliberately not an orchestration engine or a runtime. It separates agent definition from agent execution, so a definition authored once in AgentHub carries its governance posture into any supported runtime.

The platform is manifest-driven. Every agent and every solution is captured as a platform-agnostic YAML manifest that encodes business intent, capabilities, constraints, tool bindings, and governance metadata. Builder and Deployer adapters then transform and ship these manifests to target platforms such as SynaptAO and ServiceNow, with additional platforms on the roadmap.

Core Principle: Define Once, Deploy Anywhere

Governance travels with the manifest, not with deployment. The same agent definition can target SynaptAO today and another supported platform tomorrow without re-authoring the definition or re-configuring its controls.

1.2 The Seven Core Capabilities

AgentHub v1.0 organizes its functionality into seven core capabilities. Each is covered in a dedicated chapter of this guide.

#	Capability	Purpose
1	Agents	Full lifecycle of individual agent definitions: catalog, create, update, manifest, build, test, deploy, and manage
2	Solutions	Full lifecycle of agentic workflows that compose agents, systems, and human actors into business use cases
3	Governance	Change management, observability, and policy controls across agents and workflows
4	Pricing Tool	Commercial configuration and a Single Pane of Glass dashboard for sales leaders
5	Admin Functions	Metadata, roles, user groups, users, and brand management
6	User Functions	Self-service management of user details and passwords
7	Support	User support with ChatBot, Quick Tour, Wiki, Demos and Service Requests

1.3 Who Should Use This Guide

- Business and domain users discovering and consuming agents and solutions from the catalogs
- Developers and architects creating agent definitions, manifests, and BPMN workflows
- Reviewers and Approvers participating in version control and change management

- Sales leaders using the Pricing Tool and its Single Pane of Glass dashboard
- Administrators managing metadata, roles, users, and branding

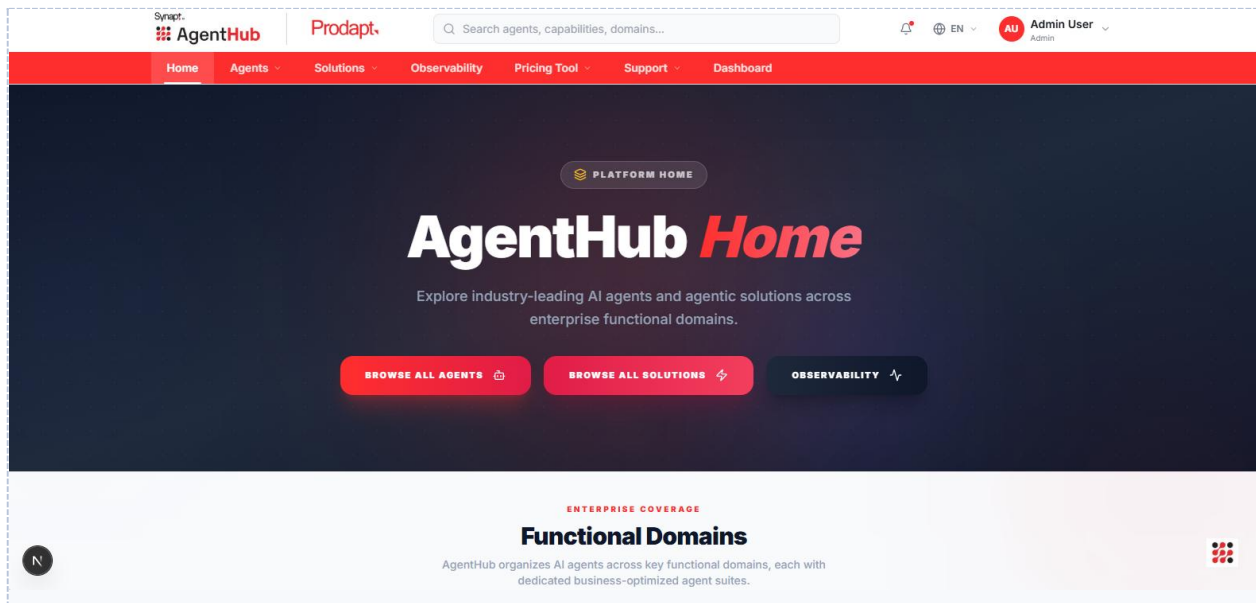

Figure: AgentHub home page showing core capabilities in the main navigation

1.4 Getting Started

Access AgentHub through your organization's provisioned URL and sign in with your onboarded credentials. New users are onboarded through the User Management approval workflow described in Chapter 6. After sign-in, the top navigation presents the capabilities available to your role, as permissions are governed by Role Management.

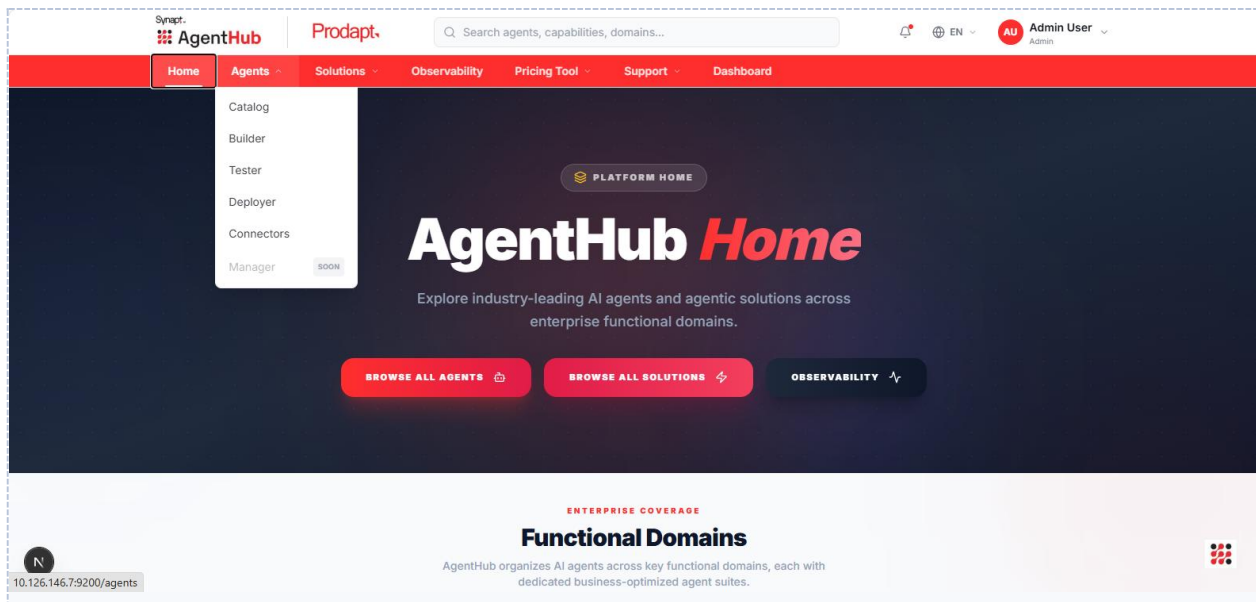

Figure: After sign-in page, the post-login landing view with navigation

2. Agents

The Agents capability manages the complete lifecycle of individual agent definitions, from discovery in the catalog through creation, versioned updates, platform-agnostic manifests, platform-specific builds, testing, deployment, and environment-bound management. AgentHub abstracts the target platform, so a single definition serves multiple runtimes.

Feature	What it does	Availability
Catalog	Browse 250+ platform-abstracted agent definitions across business domains	Available Now
Create	Define a new agent via data form or import (YAML manifest, ServiceNow XML)	Available Now
Update	Create a new agent version with Reviewer review and Admin approval	Available Now
Manifest	Platform-agnostic agent definition in YAML schema	Available Now
Builder	Transform manifests for target platforms (SynaptAO, ServiceNow)	Partially Available
Tester	Validate agent outcomes against test cases with provided inputs	Partially Available
Deployer	Deploy Builder packages to supported platforms (Docker to SynaptAO)	Partially Available
Manager	Bind agents to dev, test, and prod environments for lifecycle management	On Roadmap

2.1 Agents Catalog

AVAILABLE NOW 250+ agent definitions available in the platform today

The Agents Catalog is the single source of truth for agent definitions across the enterprise. It holds a collection of agent definitions that abstract the underlying platform, organized across business domains such as Telco Network Operations, Plan and Build, IT Operations etc. The platform currently ships with more than 250 agent definitions.

Users browse and search the catalog to discover existing agents before building new ones, compare candidates for a use case, and open any agent to view its card, manifest, version history, and readiness status. Catalog-first discovery is the primary mechanism for reuse and for preventing agent sprawl.

- Filter by business domain, lifecycle status, customer, execution platform
- **Roadmap:** Filter with Rating, No. of Views, Version, Autonomy Level
- Open an agent to view its human-readable summary and full manifest
- **Roadmap:** Trace versions and their review and approval history

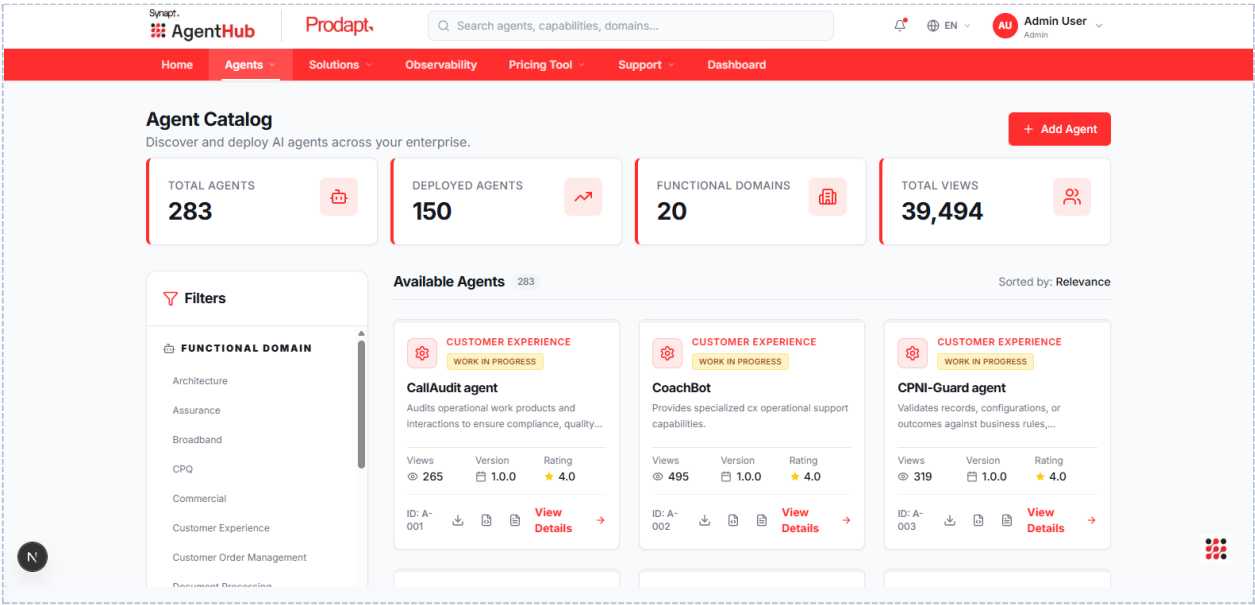

Figure: Agents Catalog grid with domain filters and search

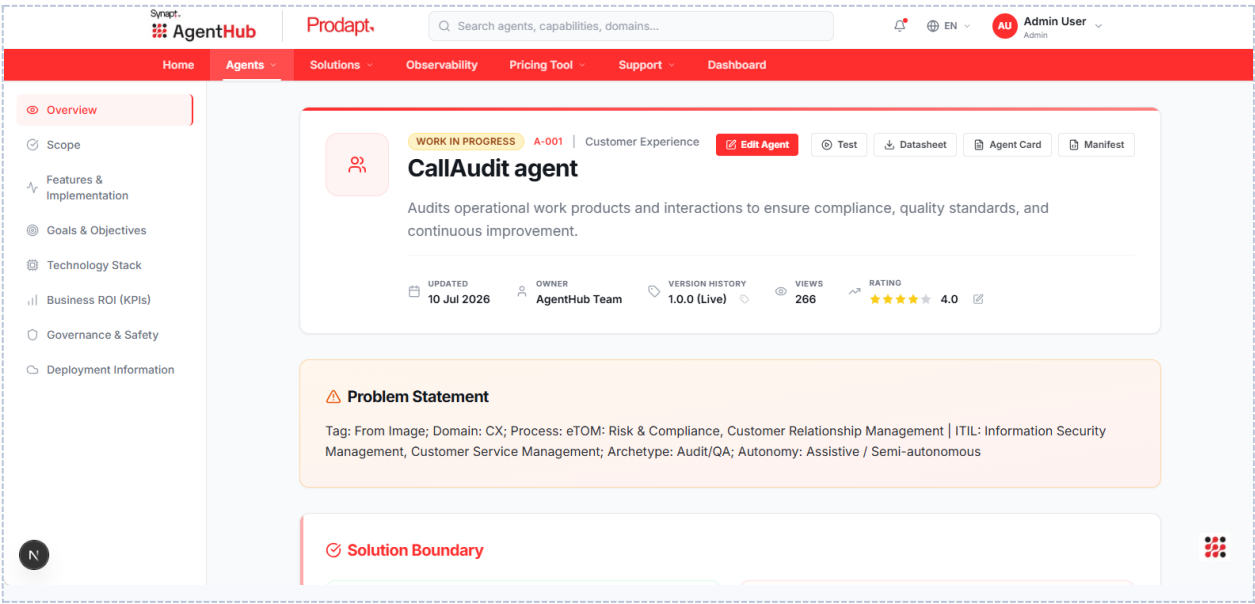

Figure: Agent detail page showing datasheet, card, manifest, edit and test options

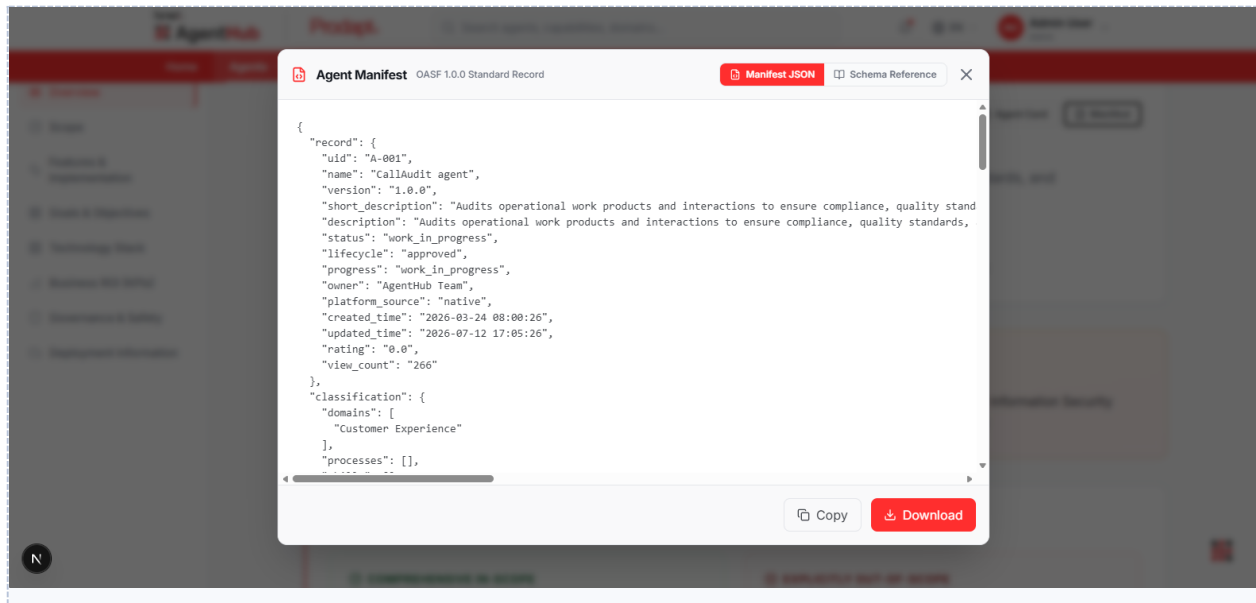

Figure: Agent manifest files – a platform agnostic YAML schema for an agent

2.2 Create Agent

AVAILABLE NOW Form-based creation plus YAML manifest and ServiceNow XML import

Create Agent supports two entry paths. Authors can define a new agent from a guided data form, capturing business intent, capabilities, constraints, inputs and outputs, tools, KPIs, and governance metadata field by field. Alternatively, authors can import an existing definition from a YAML manifest or from ServiceNow XML exports, and AgentHub normalizes the import into its platform-agnostic schema.

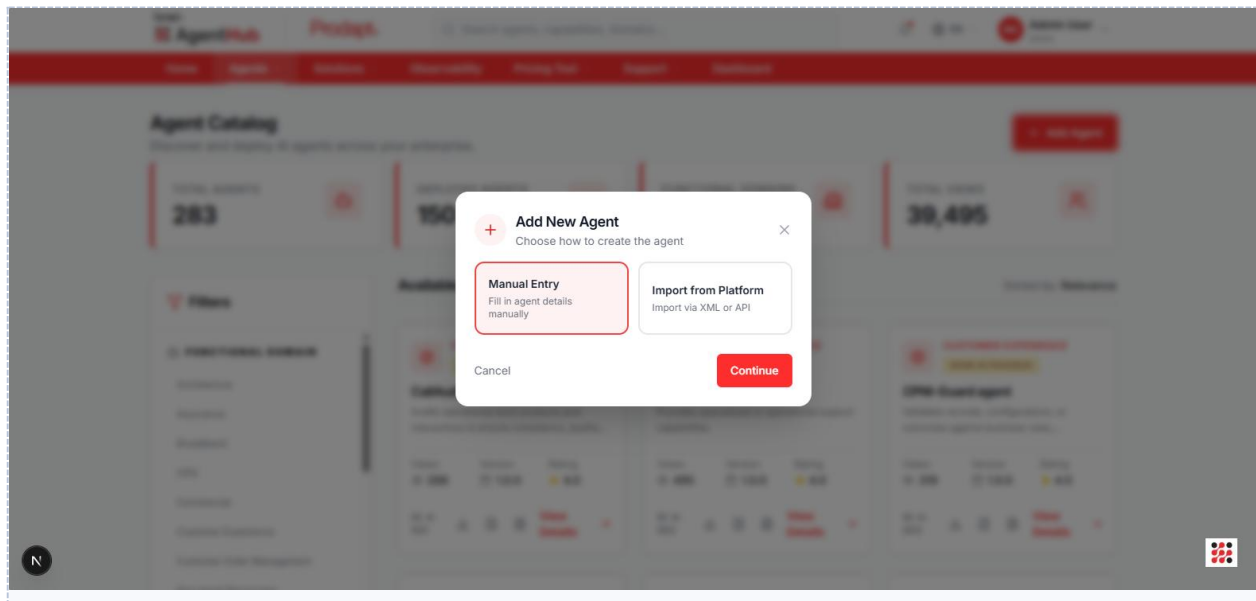

Figure: Create Agent options – manual data form or import from other platform formats (YAML/XML)

Support for additional import formats and source platforms is on the roadmap, extending the same normalize-on-import approach to a broader ecosystem.

- Data form: step-by-step authoring with schema validation at each step
- YAML import: upload a manifest that conforms to the AgentHub schema
- ServiceNow XML import: transform ServiceNow agent exports into AgentHub definitions
- **Roadmap:** import adapters for additional formats and platforms

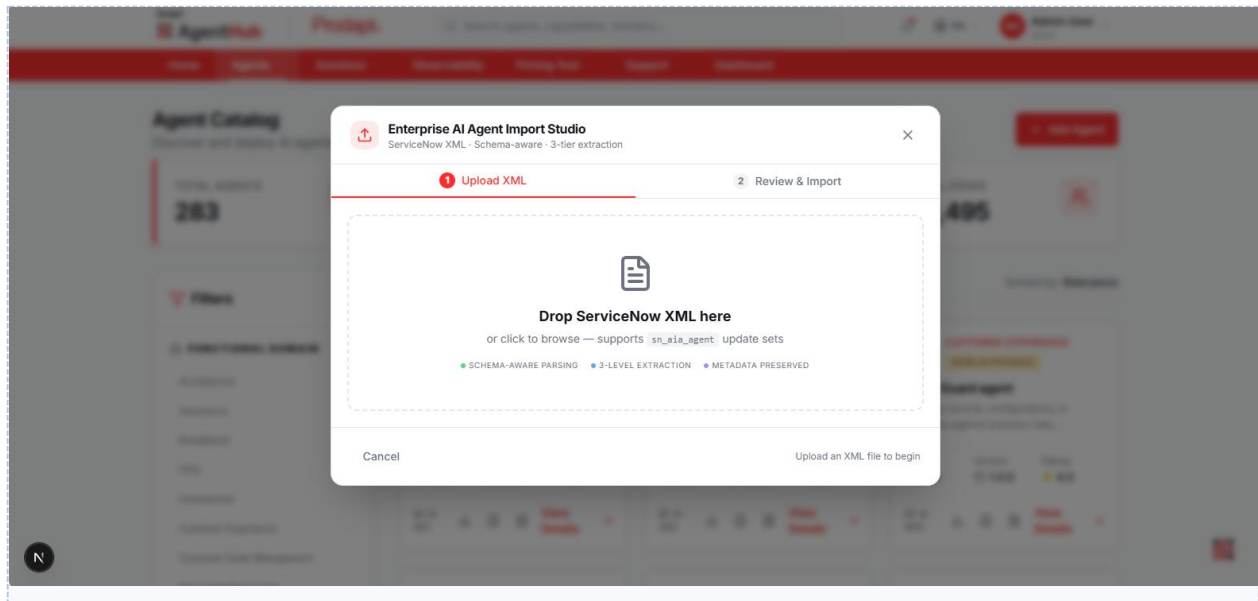

Figure: Import dialog showing ServiceNow XML to browse to ingest in the platform

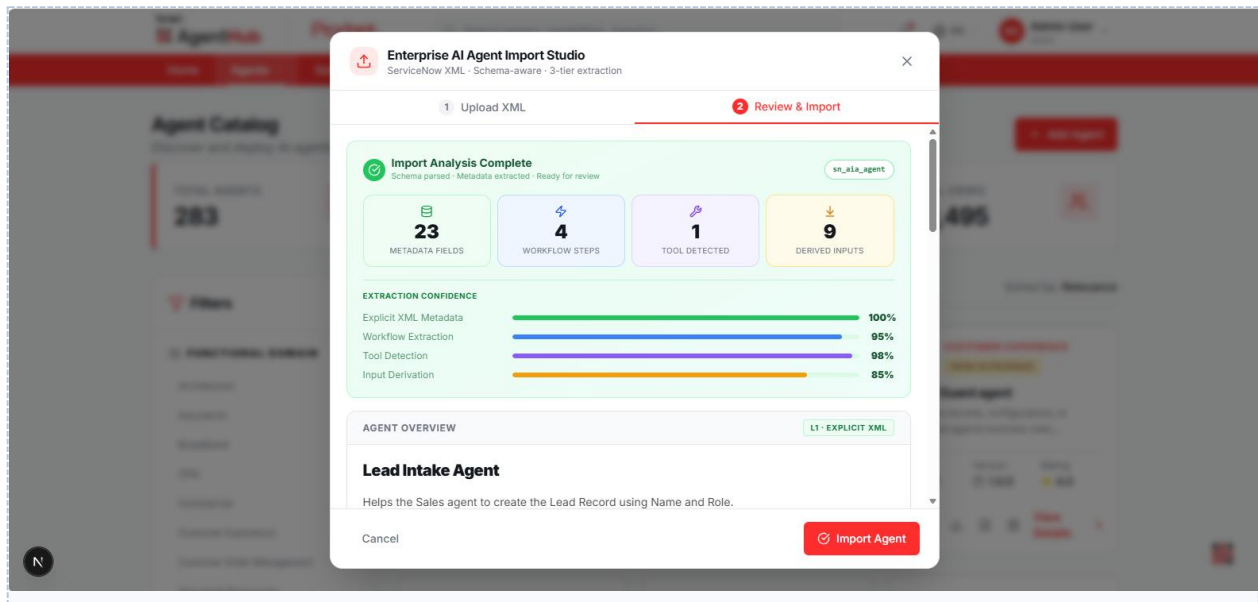

Figure: Review the imported agent from ServiceNow XML before ingesting in the platform

Figure: New agent creation guided data form and submit for review

2.3 Update Agent

AVAILABLE NOW Version-controlled updates with Reviewer and Admin approval

Updating an agent never mutates the active definition in place. Every update creates a new version of the agent, which enters the change management workflow: a Reviewer reviews the proposed changes, and an Admin approves the version for publication.

AgentHub Prodapt Search agents, capabilities, domains... AU Admin User Admin

General Workflow Technology Goals & KPIs Governance

Goals, Objectives & KPIs

Strategic Goals & Objectives + ADD

Detect compliance and quality deviations early.

Produce audit evidence, scorecards, and coaching feedback.

Drive continuous improvement through trend insights.

Key Performance Indicators (KPIs) + ADD KPI

KPI NAME / METRIC	TARGET VALUE
CSAT/NPS impact	e.g. > 99%

Figure: Update flow showing version diff and review submission

This preserves an immutable version of history and guarantees that the catalog only exposes governed, approved definitions.

- Edit any field of an existing definition to produce a new candidate version
- Submit the candidate for review; the Reviewer examines the change set
- Admin approval publishes the new version; prior versions remain in history

Version Control Discipline

The Reviewer and Approver roles are defined in Role Management (Chapter 6) and enforced by the Governance Lifecycle capability (Chapter 4). No agent version reaches the catalog without passing through this chain.

2.4 Agent Manifest

AVAILABLE NOW

The Agent Manifest is the heart of AgentHub: a platform-agnostic agent definition expressed in a YAML schema. The manifest captures everything a platform needs to know about an agent without binding the definition to any specific runtime: identity and versioning, business intent, capabilities, tool bindings, autonomy level, governance posture, compliance metadata, and KPIs.

Because the manifest is the contract, downstream capabilities operate on it directly: Builder transforms it for target platforms, Tester validates behavior against it, and Governance enforces the posture it declares.

- View and download the YAML manifest for any cataloged agent
- Validate manifests against the AgentHub schema before submission
- Manifests are versioned in lockstep with the agent version

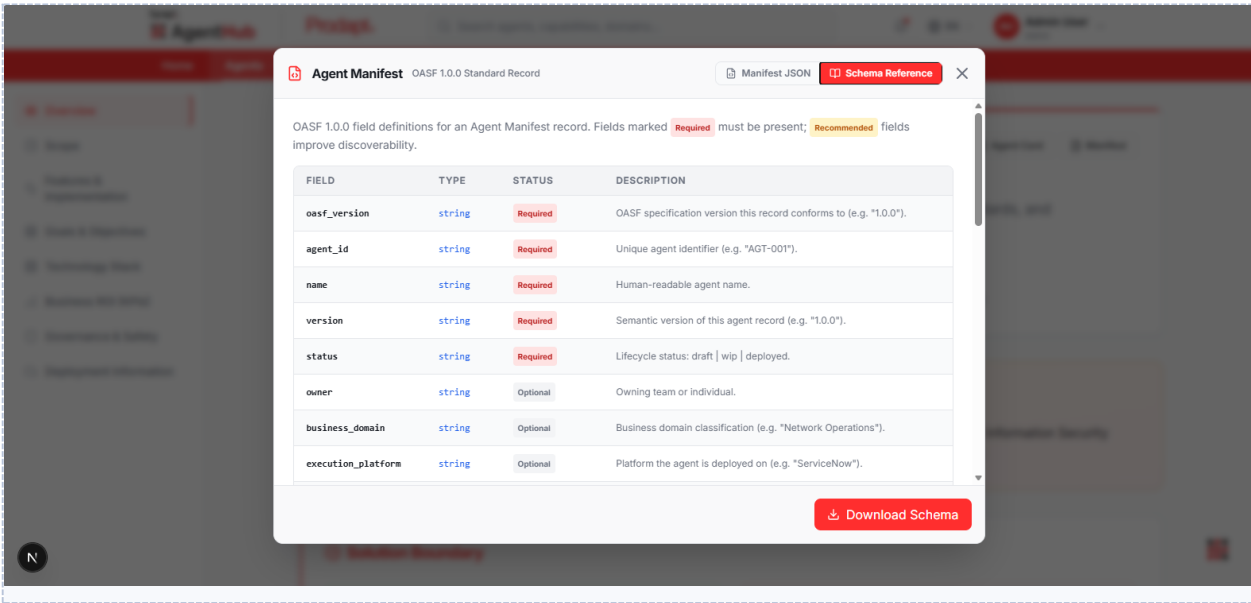

Figure: Agent Manifest viewer with YAML schema highlighting

2.5 Agents Builder

PARTIALLY AVAILABLE *SynaptAO and ServiceNow supported today; Salesforce, Snowflake, GCP, AWS, and Azure on roadmap*

Agents Builder converts the platform-agnostic manifest into a platform-specific package through adapters. Each adapter understands the target platform's constructs and translates manifest declarations into the artifacts that platform expects. SynaptAO and ServiceNow adapters are supported today. Adapters for Salesforce, Snowflake, GCP, AWS, and Azure are on the roadmap.

- Select a cataloged agent version and a target platform
- The adapter generates the platform-specific package from the manifest
- Build outputs are versioned and traceable back to the source manifest

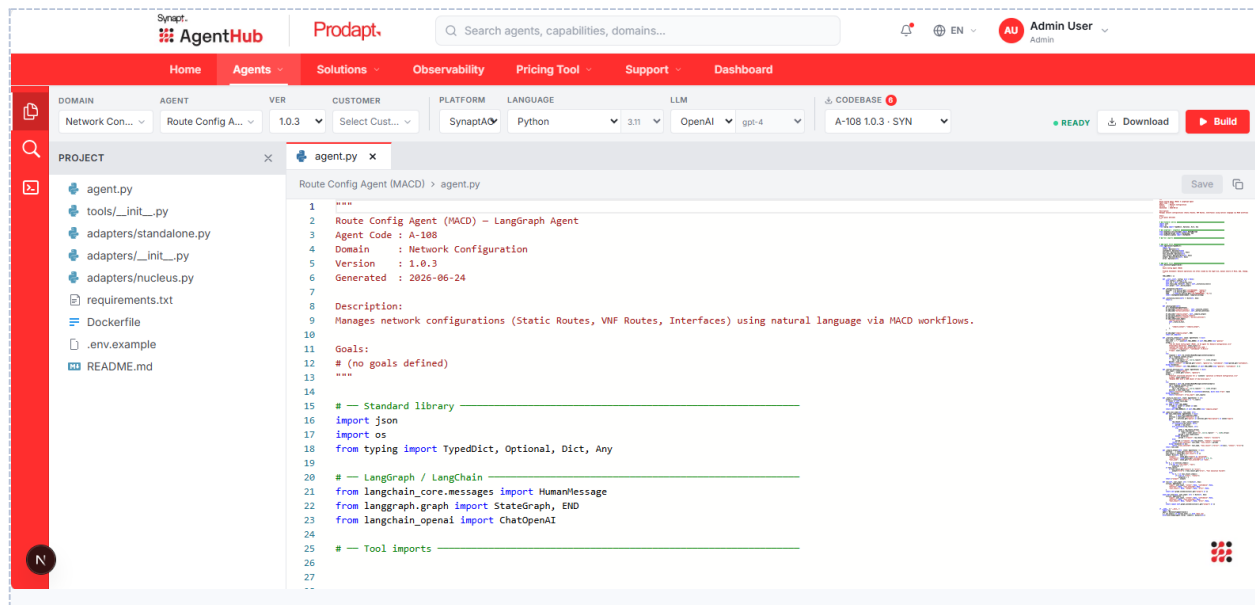

Figure: Builder screen with target platform selection and build output for SynaptAO

2.6 Agent Tester

PARTIALLY AVAILABLE *Existing capabilities to be extended and new capabilities are on roadmap*

Agent Tester validates an agent's behavior against defined test cases. Testers provide the required inputs for each case and execute the agent to validate its outcome against expectations. Test results form part of the evidence used at review and approval time, and they are the practical gate between a definition that looks correct and one that behaves correctly.

- Define test cases with required inputs and expected outcomes
- Execute individual cases or full suites against an agent version
- Review pass and fail outcomes with captured actual results

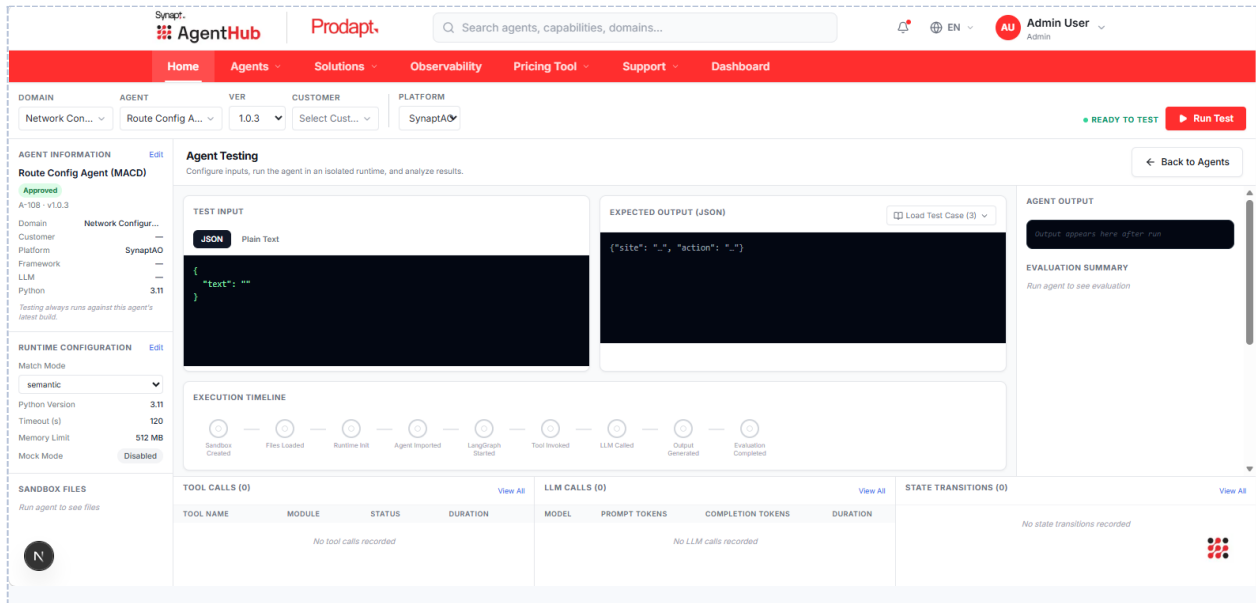

Figure: Agent Tester with test case list, inputs, and outcome validation

2.7 Agent Deployer

PARTIALLY AVAILABLE Docker image deployment to SynaptAO supported today; additional platform deployments on roadmap

Agent Deployer takes the package produced by Builder and deploys it to a supported platform through deployment adapters. Today, Docker images are supported for deployment into SynaptAO. Deployment adapters for additional platforms are on the roadmap, following the same adapter pattern as Builder.

- Select a built package and a supported deployment target
- Deployer ships the Docker image into SynaptAO
- Deployment records link the running instance back to the manifest version

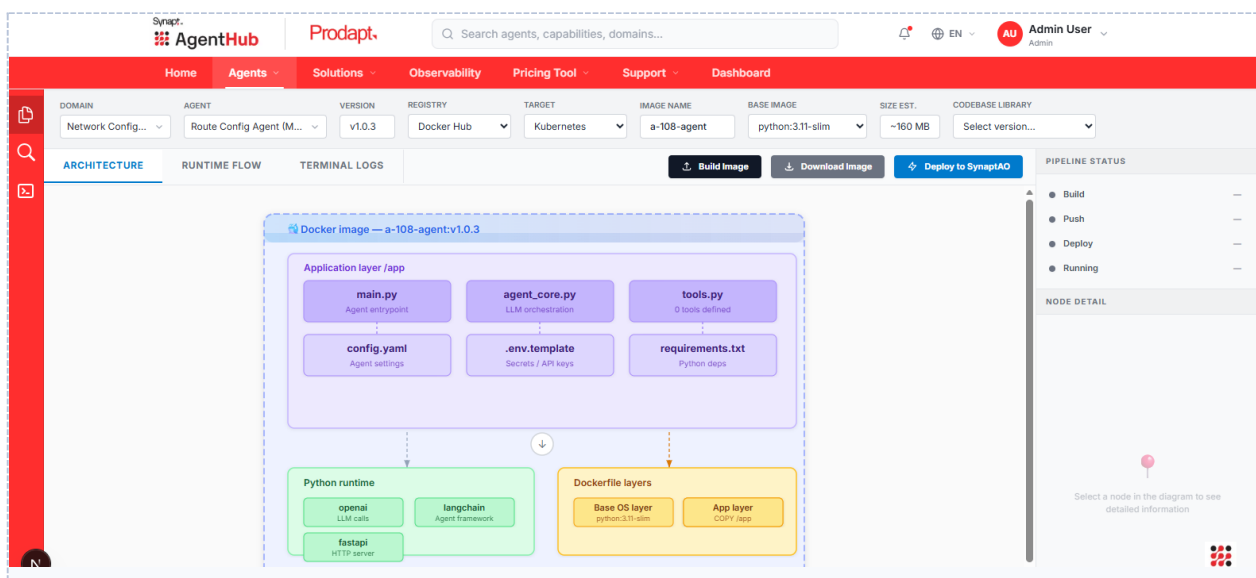

Figure: Deployer screen showing package selection and deployment status

2.9 Agent Connectors

ON ROADMAP Starting with SynaptAO (LangChain, LangGraph), then ServiceNow, Salesforce, Snowflake, GCP, AWS, Azure

Agent Connectors build a rich catalog of adapters to integrate with various platforms with agents to integrate or deploy. This feature will provide flexibility to agents to work with a common design pattern for integrations and deployments using low-code configurations only. The capability is on the roadmap and will start with tech platforms like SynaptAO (LangChain, LangGraph), ServiceNow, Snowflake, GCP, AWS, Azure and others.

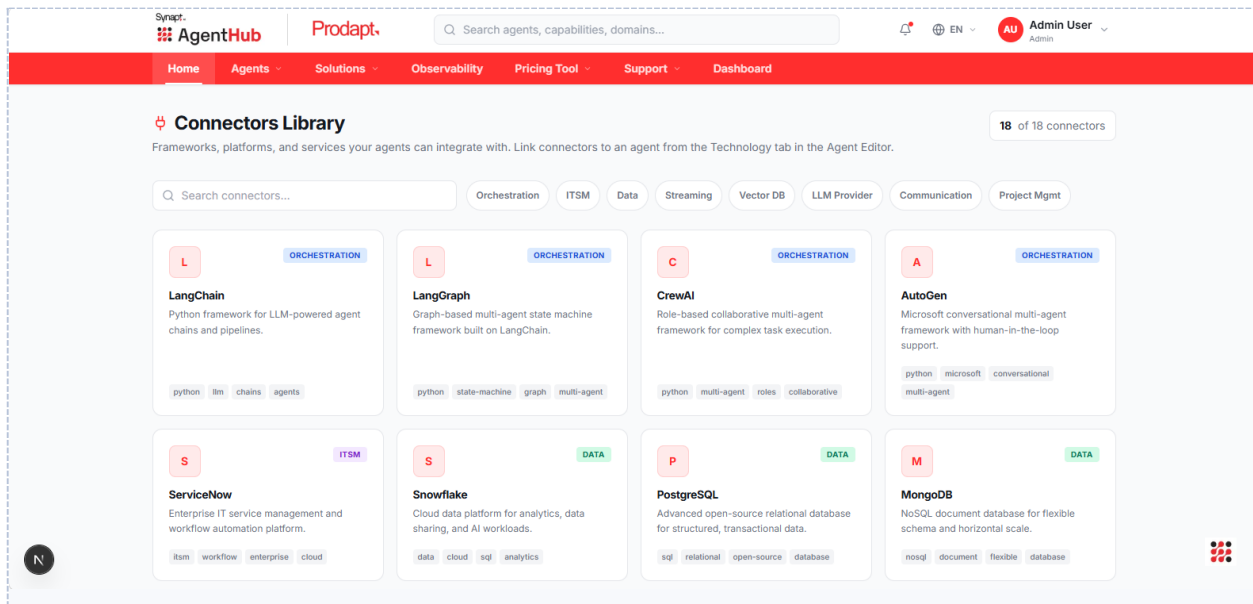

Figure: Concept view of Agent Connectors Library for integrations and deployment (roadmap)

2.8 Agent Manager

ON ROADMAP Starting with SynaptAO, then ServiceNow, Salesforce, Snowflake, GCP, AWS, Azure

Agent Manager will bind agents to environments (dev, test, prod) to manage the full runtime lifecycle of deployed agents: promotion across environments, environment-specific configuration, and controlled retirement. The capability is on the roadmap and will start with SynaptAO, then extend to ServiceNow, Salesforce, Snowflake, GCP, AWS, Azure, and further platforms.

3. Solutions

Where the Agents capability governs individual agents, Solutions governs agentic workflows: compositions that combine agents, systems and automations, and human actors into end-to-end business use cases. Solutions follow the same lifecycle shape as Agents (Catalog, Create, Update, Manifest, Builder, Tester, Deployer, Manager), applied at the workflow level.

Feature	What it does	Availability
Catalog	Browse platform-abstracted workflow definitions across business domains	Available Now
Create	Define a new BPMN workflow combining agents, systems, and human actors	Available Now
Update	Create a new workflow version with Reviewer review and Admin approval	Available Now
Manifest	Platform-agnostic workflow definition in YAML schema	Available Now
Builder	Transform workflow manifests for platforms (manual today; adapters on roadmap)	On Roadmap
Tester	Validate workflow outcomes against test cases with events and inputs	On Roadmap
Deployer	Deploy workflows to supported platforms	On Roadmap
Manager	Bind workflows to dev, test, and prod environments	On Roadmap

3.1 Solutions Catalog

AVAILABLE NOW

The Solutions Catalog is a collection of agentic workflow definitions that abstract the underlying platform, organized across business domains in the same way as the Agents Catalog. Users discover existing workflows for their business use cases, inspect the composition of agents, systems, and human actors within each workflow, and reuse proven patterns rather than rebuilding them.

- Filter workflows by business domain, platform, and lifecycle status
- Open a workflow to view its BPMN diagram, participants, and manifest
- Participants are Agents, Systems and Personas
- Trace which agents from Agents Catalog participate in each workflow
- Systems and Personas are defined in the metadata by Admin

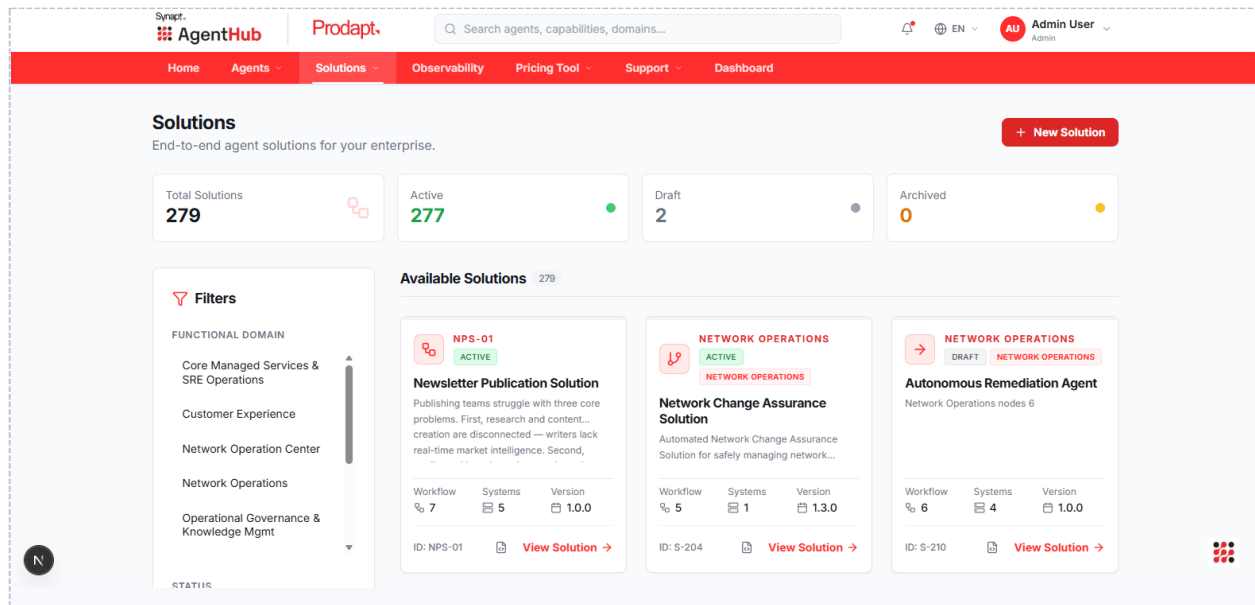

Figure: Solutions Catalog with domain filters

3.2 Create Solution

AVAILABLE NOW

Create Solution defines a new BPMN workflow for a business use case. The workflow composes participants in any combination: agents from the Agents Catalog, systems and automations, and human actors (personas). BPMN provides the standard notation for sequencing, branching, parallelism, and human task steps, so workflows read the same to business and technical audiences.

- Model the workflow in BPMN with agents, system/automation steps, and human/actor steps
- Bind agent steps to specific cataloged agent versions
- Declare events and inputs that trigger and drive the workflow

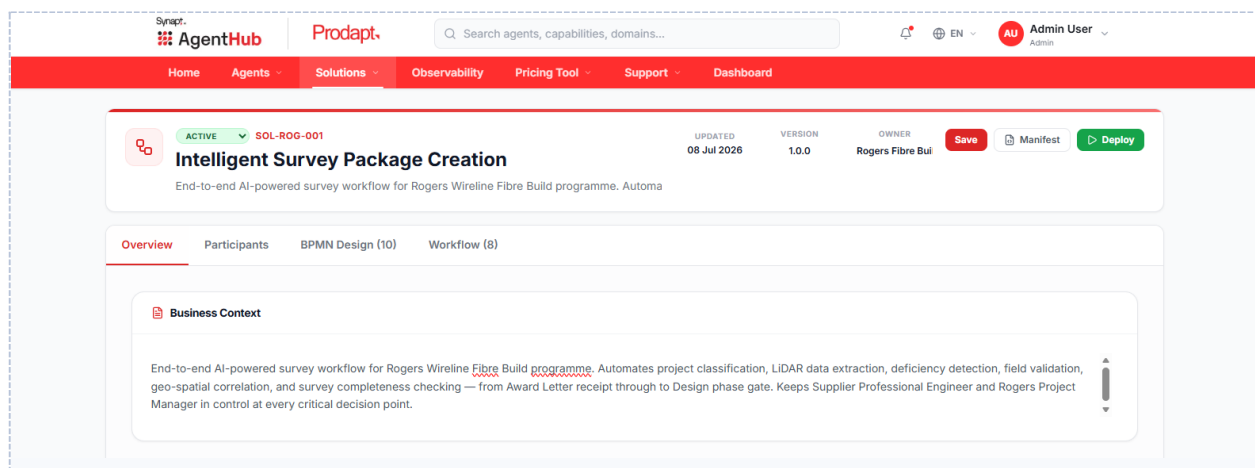

Figure: Solution detail page with Overview, Participants, and BPMN Workflow

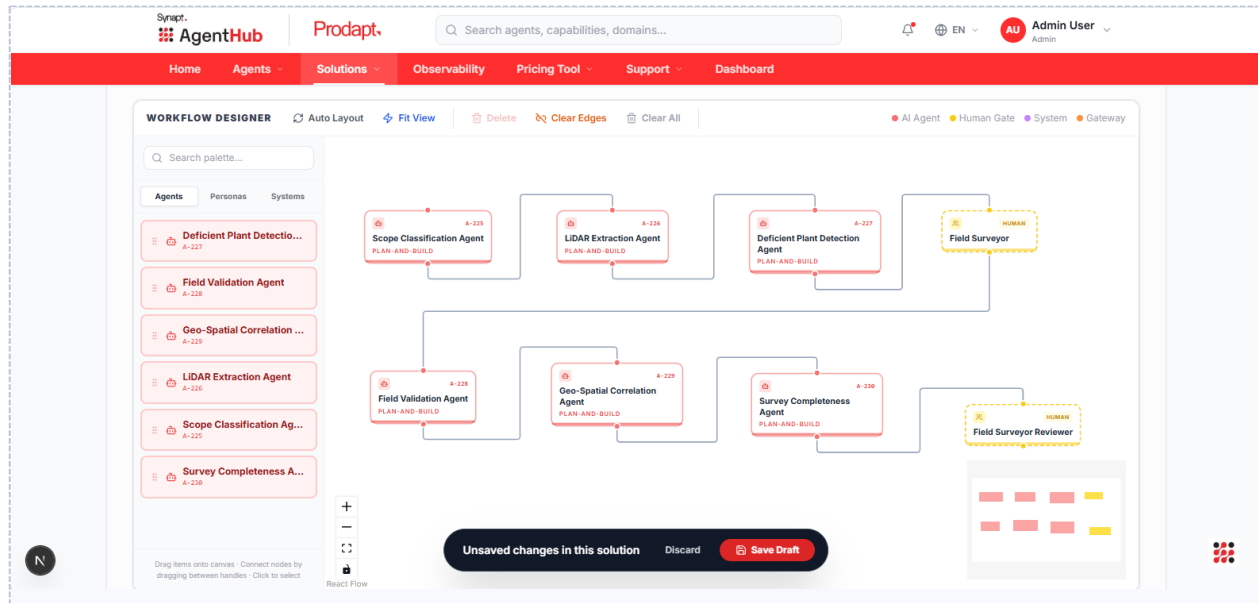

Figure: BPMN workflow designer with agent, system, and human lanes

3.3 Update Solution

AVAILABLE NOW

As with agents, workflow updates are version controlled. Editing a workflow definition creates a new version, a Reviewer reviews the change, and an Admin approves it for publication. Version history preserves every prior state of the workflow.

- Modify the BPMN definition or its bindings to produce a candidate version
- Reviewer review followed by Admin approval publishes the version

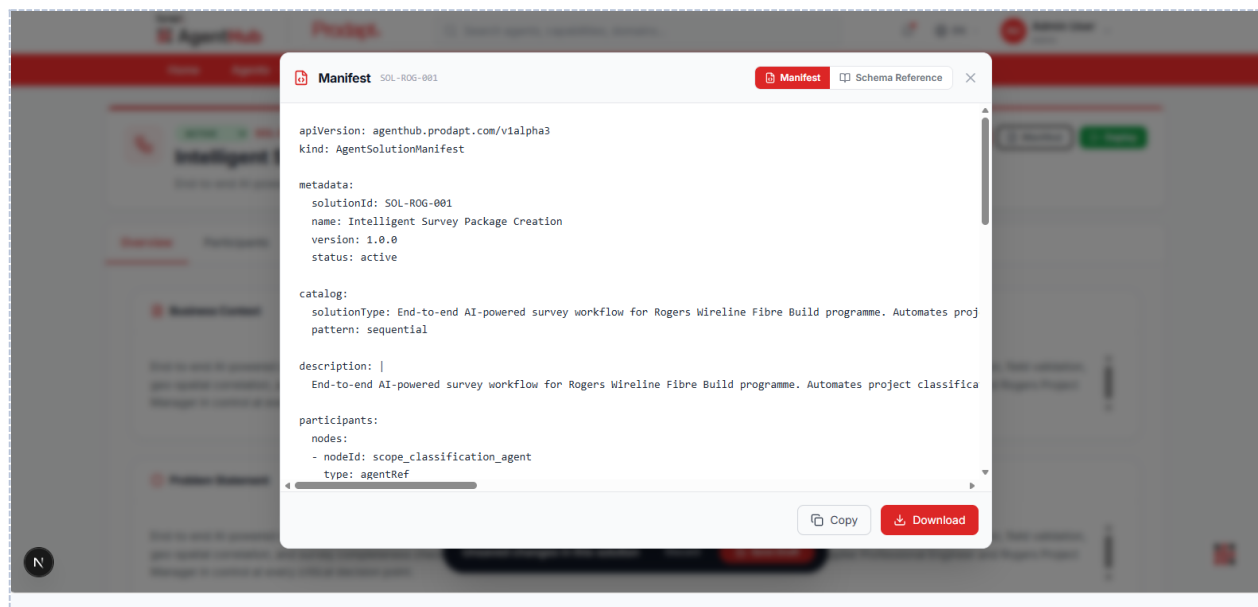

Figure: Solution version updated for review and manifest change accordingly

3.4 Solution Manifest

AVAILABLE NOW

The Solution Manifest is the platform-agnostic workflow definition in YAML schema. It captures the workflow topology, participating agents with version bindings, system and human participants, and events and inputs, in a form that is independent of any execution platform. The Solution Manifest is to workflows what the Agent Manifest is to agents: the single contract from which platform-specific artifacts are derived.

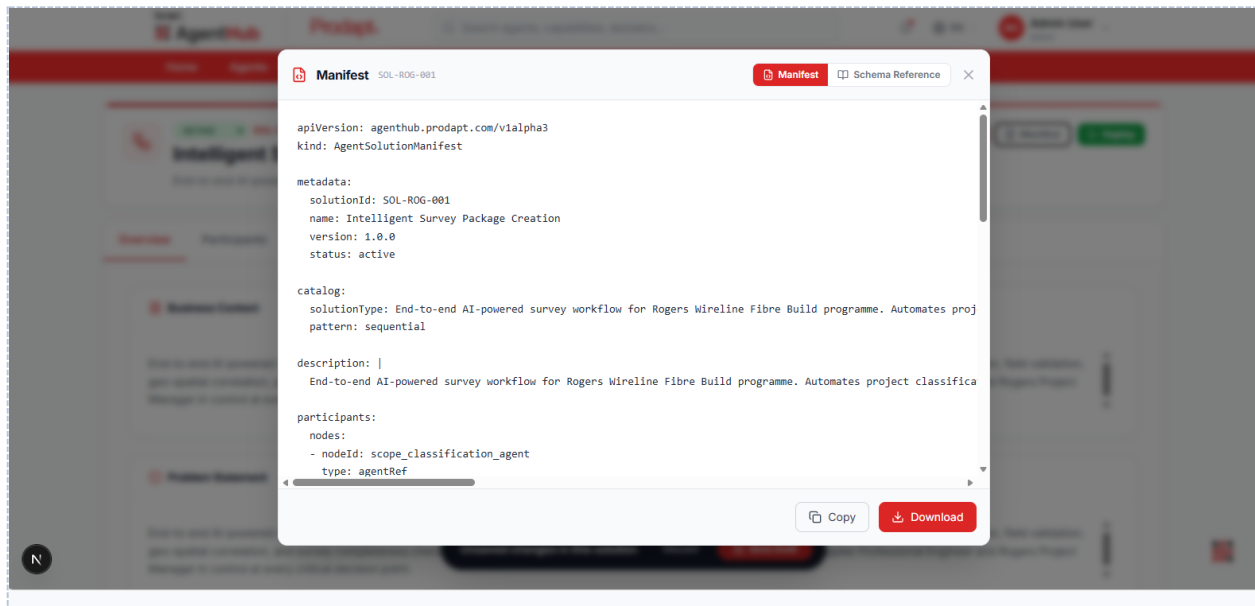

Figure: Solution Manifest viewer in YAML

3.5 Solutions Builder

ON ROADMAP *Workflows are built manually today; adapter roadmap covers SynaptAO, ServiceNow, Salesforce, Snowflake*

Solutions Builder will transform Solution and Workflow Manifests into platform-specific workflow implementations through adapters, mirroring the Agents Builder pattern. Today, workflows are built manually for target platforms. The adapter roadmap covers SynaptAO, ServiceNow, Salesforce, and Snowflake.

3.6 Solution Tester

ON ROADMAP *Build test capabilities to validate simulate workflow for various test cases based on deployment platforms*

Solution Tester validates a workflow against test cases by providing the required events and inputs and validating the outcome. Because workflows span multiple participants, testing at this level verifies the composition: handoffs between agents, system steps, and human task points behave as designed.

- Define test cases with triggering events and inputs
- Execute cases and validate workflow outcomes end to end
- Validate platform specific test cases too

3.7 Solution Deployer

ON ROADMAP *Build SynaptAO, ServiceNow, Salesforce, Snowflake specific deployment capabilities*

Solution Deployer will deploy workflows to supported platforms through deployment adapters. The roadmap covers SynaptAO, ServiceNow, Salesforce, and Snowflake.

3.8 Solution Manager

ON ROADMAP *Starting with SynaptAO, then ServiceNow, Salesforce, Snowflake*

Solution Manager will bind workflows to environments (dev, test, prod) to manage the deployed workflow lifecycle. The capability is on the roadmap, starting with SynaptAO and then extending to ServiceNow, Salesforce, and Snowflake.

4. Governance

Governance is what turns a catalog into a control plane. AgentHub governance spans three areas: Lifecycle change management of agents and workflows through specialized roles, Observability of agent performance through runtime telemetry, and Policy definition and enforcement across agents.

Feature	What it does	Availability
Lifecycle	Manage lifecycle for agents and workflows with two specialized roles: Reviewer and Approver	Available Now
Observability	Monitor agents' performance by collecting telemetry from a specific agent runtime	Partially Available
Policy	Define agent policies centrally and apply them across agents for a specific agent runtime	On Roadmap

4.1 Lifecycle

AVAILABLE NOW

Lifecycle provides change management for agents and workflows using two specialized roles: Reviewer and Approver. Every create and update flows through this chain. The Reviewer examines the proposed definition or changes set for correctness, completeness, and alignment with standards. The Approver (Admin) makes the publication decision. Each transition is recorded with identity and timestamp, building the audit trail of who changed what, who reviewed it, and who approved it.

- Review queues for pending agent and workflow versions
- Approve or reject decisions with recorded identity and timestamp
- Full change history per agent and per workflow

The screenshot shows the AgentHub Admin Portal. The top navigation bar includes the AgentHub logo, a search bar, and user information (Admin User). The sidebar on the left lists various sections: Dashboard, Governance, Audit Logs, Catalog Management (Agents, Domains, Customers, Personas, Execution Platforms), User Management (Users, Permissions), and Integrations (External Systems). The main content area is titled 'Approval Center' and shows a review queue. It includes a table for 'Awaiting Review' with columns for Agent Name, Domain, Version, Author, Date, and Actions. The table contains one entry: 'Lead Intake Agent' from the 'Servicenow' domain, version '1.0.0', authored by 'System' on '7/7/2026'. Below the table, there is a section for 'Awaiting Approval' which currently shows 'No items awaiting action.'

Figure: Lifecycle review queue and approval actions

4.2 Observability

PARTIALLY AVAILABLE Currently able to fetch SynaptAO telemetries, roadmap to extend for other platforms

Observability monitors agent performance by collecting telemetry from a specific agent runtime. Telemetry surfaces how deployed agents behave in practice: execution outcomes, performance characteristics, and consumption. This closes the loop between definition and operation, letting owners verify that agents meet their declared KPIs and spot degradation early.

- Connect a runtime and collect telemetry for its agents
- View per-agent performance dashboards
- Use observed performance as input to version updates and reviews

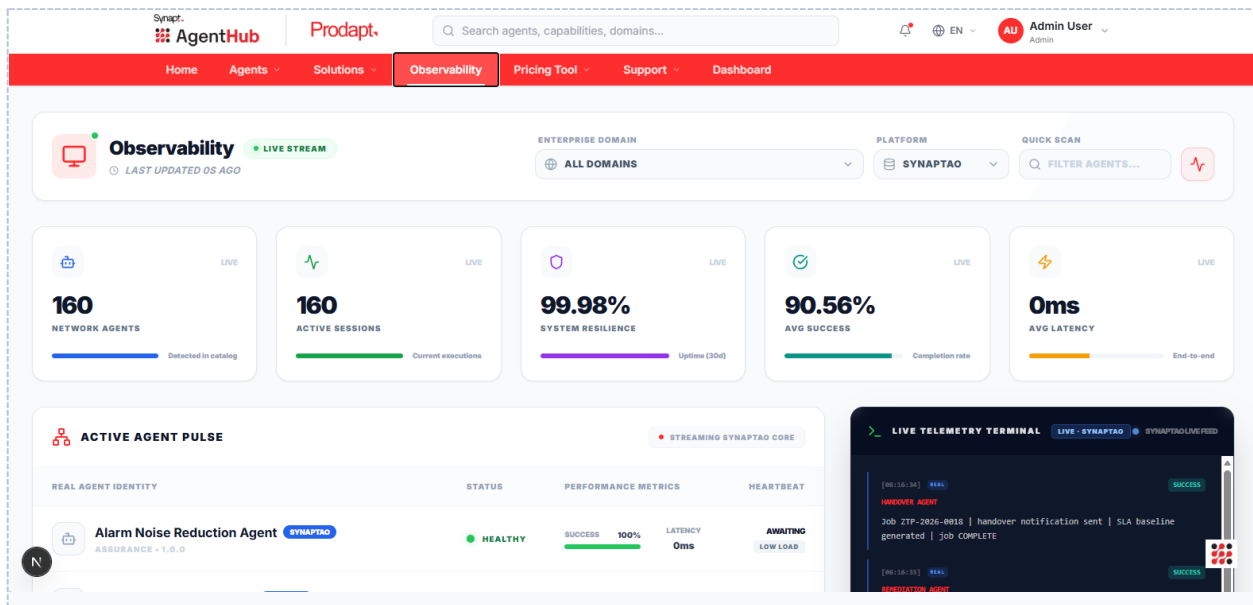

Figure: Observability dashboard with agent runtime telemetry

4.3 Policy

ON ROADMAP

Policy will define agent policies centrally and apply them across agents for a specific agent runtime. Planned policy types include tiered model routing, token budgets, and prompt caching, giving platform teams a single point of control over cost and behavior rather than configuring each agent individually. This capability is on the roadmap.

- Define policies once: tiered model routing, token budget, prompt caching, and more
- Apply policies across selected agents for a target runtime

5. Pricing Tool

The Pricing Tool serves the commercial side of AgentHub. It combines a Single Pane of Glass dashboard for sales leaders with a Configure area where all commercial building blocks are defined: platform tiers, industry packs, LLM pricing, professional services rate cards, and support tiers.

Feature	What it does	Availability
Dashboard	Single Pane of Glass view for sales leaders covering pipeline and conversions of AgentHub	Available Now
Configure	Configure defines the commercial building blocks used to construct AgentHub offers and estimates	Available Now
Quotation	Create a quotation for an opportunity using pricing elements as define for various packs/tiers and publish	Available Now

5.1 Dashboard

AVAILABLE NOW *Enhancements are in the roadmap*

The Dashboard is a Single Pane of Glass view for sales leaders covering pipeline and conversions of AgentHub. It consolidates opportunity flow into one screen so leaders can track pipeline health and conversion performance without assembling data from multiple systems.

- Pipeline view across opportunities
- Conversion tracking across pipeline stages

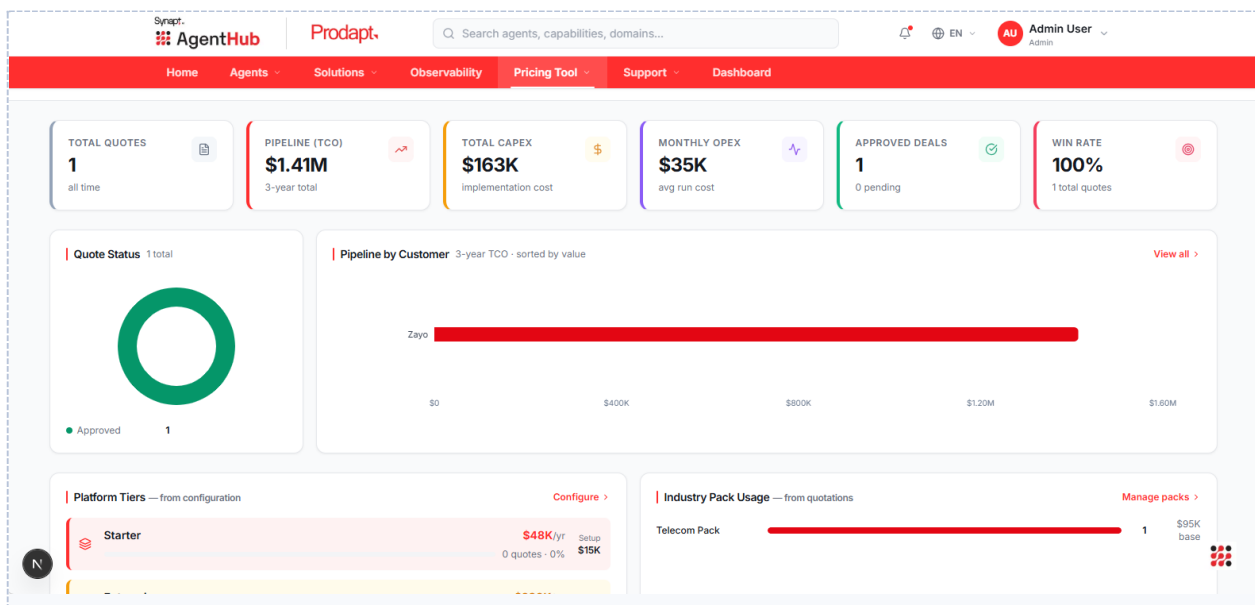

Figure: Pricing Dashboard: Single Pane of Glass for pipeline and conversions

5.2 Configure

AVAILABLE NOW

Configure defines the commercial building blocks used to construct AgentHub offers and estimates:

Configuration Area	What you define
Platform Tiers	Offering tiers such as Starter, Professional, and Enterprise
Industry Packs	Vertical packs such as Telco NOC, Telco Plan & Build, and IT Ops
LLM Pricing	Cost estimation for token consumption
Professional Services	Delivery rate card
Support Tiers	Support levels such as Basic, Standard, and Premium

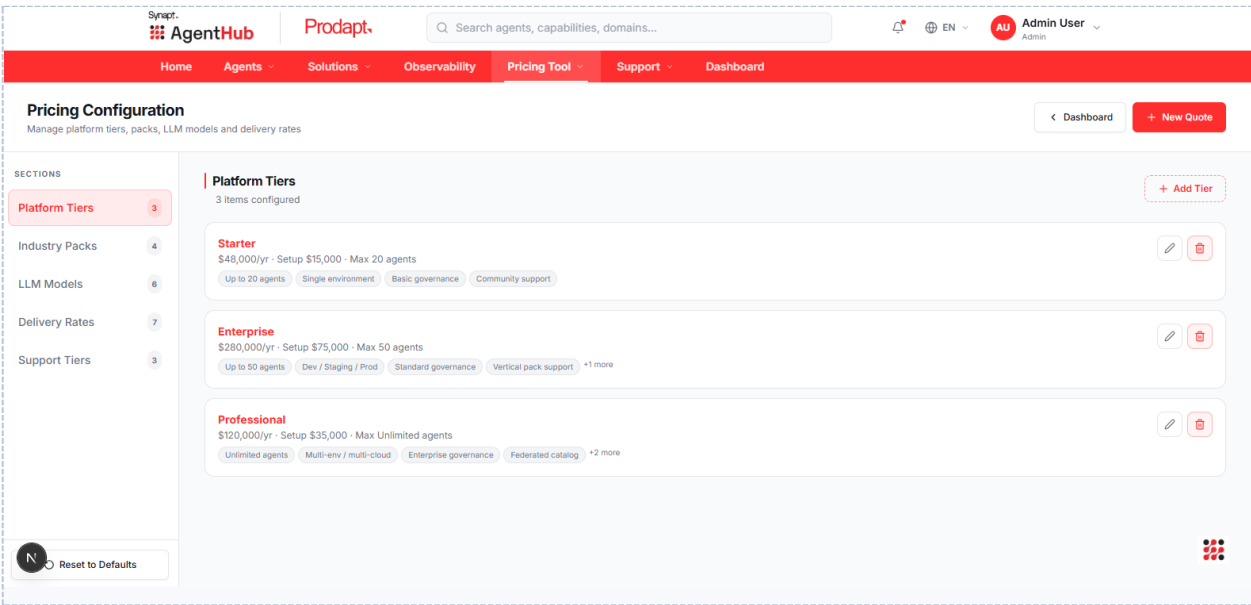

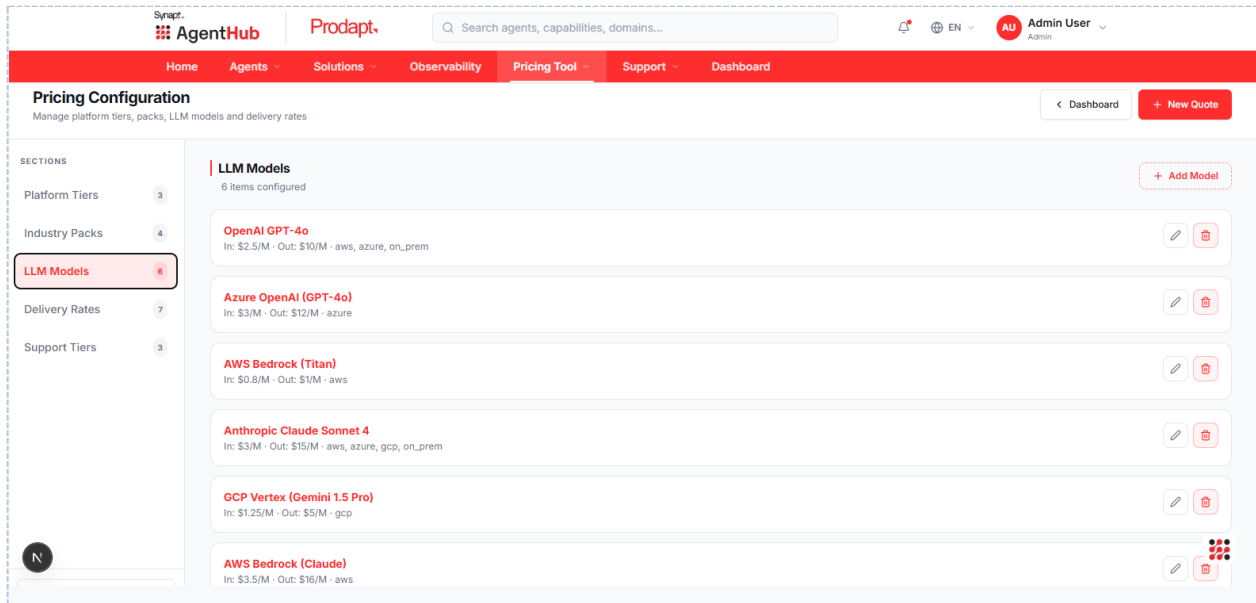

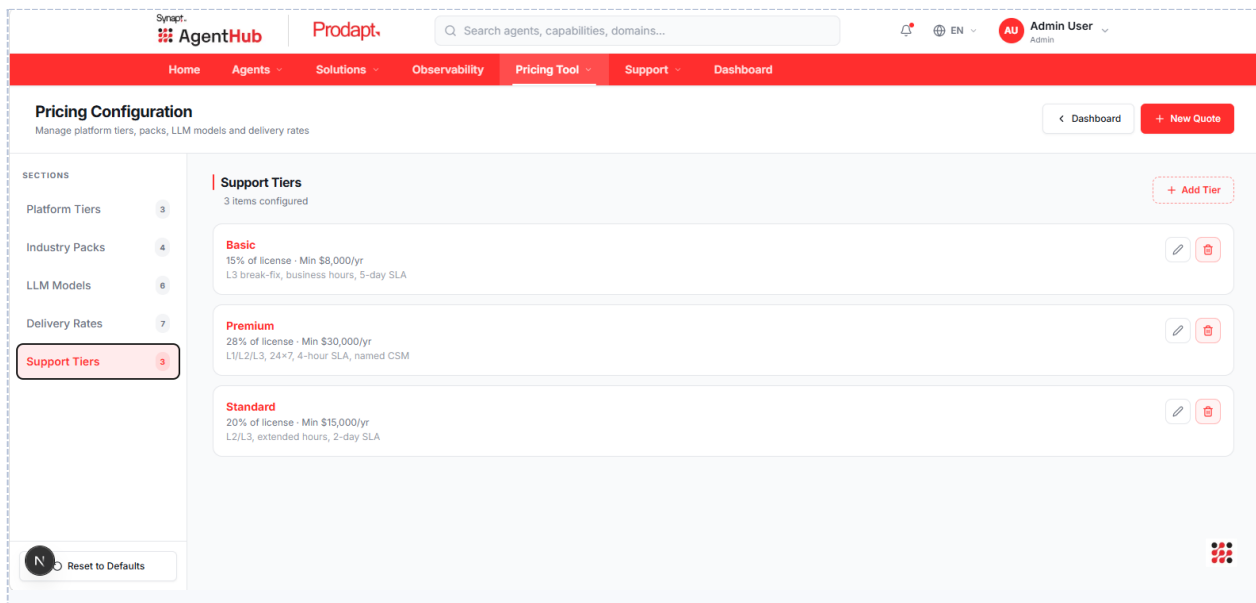

Figure: Configure area showing Platform Tiers and Industry Packs

The screenshot shows the 'Pricing Configuration' page in the AgentHub interface. The left sidebar lists sections: Platform Tiers (3), Industry Packs (4), LLM Models (6), Delivery Rates (7), and Support Tiers (3). The 'LLM Models' section is selected, showing a list of 6 configured items. Each item includes a model name, input/output token costs, and platform details. The models listed are OpenAI GPT-4o, Azure OpenAI (GPT-4o), AWS Bedrock (Titan), Anthropic Claude Sonnet 4, GCP Vertex (Gemini 1.5 Pro), and AWS Bedrock (Claude). Each model entry has edit and delete icons. A '+ Add Model' button is at the top right of the list.

Model	In	Out	Platform
OpenAI GPT-4o	\$2.5/M	\$10/M	aws, azure, on_prem
Azure OpenAI (GPT-4o)	\$3/M	\$12/M	azure
AWS Bedrock (Titan)	\$0.8/M	\$1/M	aws
Anthropic Claude Sonnet 4	\$3/M	\$15/M	aws, azure, gcp, on_prem
GCP Vertex (Gemini 1.5 Pro)	\$1.25/M	\$5/M	gcp
AWS Bedrock (Claude)	\$3.5/M	\$16/M	aws

Figure: LLM Pricing configuration with token cost estimation

The screenshot shows the 'Pricing Configuration' page in the AgentHub interface. The left sidebar lists sections: Platform Tiers (3), Industry Packs (4), LLM Models (6), Delivery Rates (7), and Support Tiers (3). The 'Support Tiers' section is selected, showing a list of 3 configured items. Each item includes a tier name, license percentage, minimum annual fee, and support details. The tiers listed are Basic, Premium, and Standard. Each tier entry has edit and delete icons. A '+ Add Tier' button is at the top right of the list.

Tier	License	Min Annual Fee	Support
Basic	15% of license	Min \$8,000/yr	L3 break-fix, business hours, 5-day SLA
Premium	28% of license	Min \$30,000/yr	L1/L2/L3, 24x7, 4-hour SLA, named CSM
Standard	20% of license	Min \$15,000/yr	L2/L3, extended hours, 2-day SLA

Figure: Support Tiers to provide support functions

5.3 Quotation

AVAILABLE NOW

Create a quotation for an opportunity using pricing elements as define for various packs/tiers and publish.

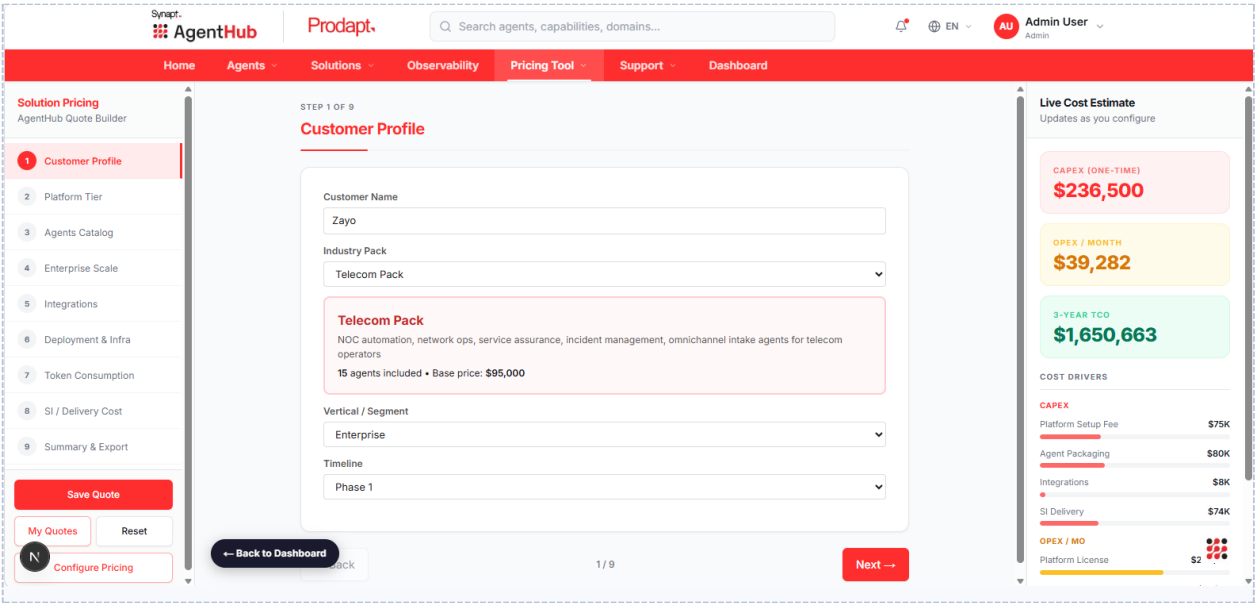

Figure: Building a quotation for an opportunity using pricing elements

6. Admin Functions

Admin Functions provide the administrative backbone of AgentHub: the metadata that structures the catalogs, the roles and permissions model, user group and user administration, and customer-specific branding.

Feature	What it does	Availability
Metadata Management	Maintains reference data for: Business Domains that organize the catalogs, Customers, Personas representing human actors	Available Now
Role Management	Defines the roles in the platform and manages their permissions on capabilities	Available Now
User-group Management	Defines user groups, binds individual users into groups, and links each group to one or many roles	Available Now
User Management	Handles onboarding of users, including the approval step	Available Now
Brand Management	Transforms the AgentHub brand color, logo, and language to match customer needs, enabling customer-specific white labeling	Partially Available

6.1 Metadata Management

AVAILABLE NOW *Enhancements are in the roadmap*

Metadata Management maintains the reference data that the rest of the platform depends on: Business Domains that organize the catalogs, Customers, Personas representing human actors used in workflow definitions, and Platforms representing build and deployment targets.

- Business Domains: the domain taxonomy behind catalog organization and filtering
- Customers: customer records used across the platform
- Personas: human and actor definitions referenced in Solutions
- Platforms: the registry of supported and roadmap target platforms

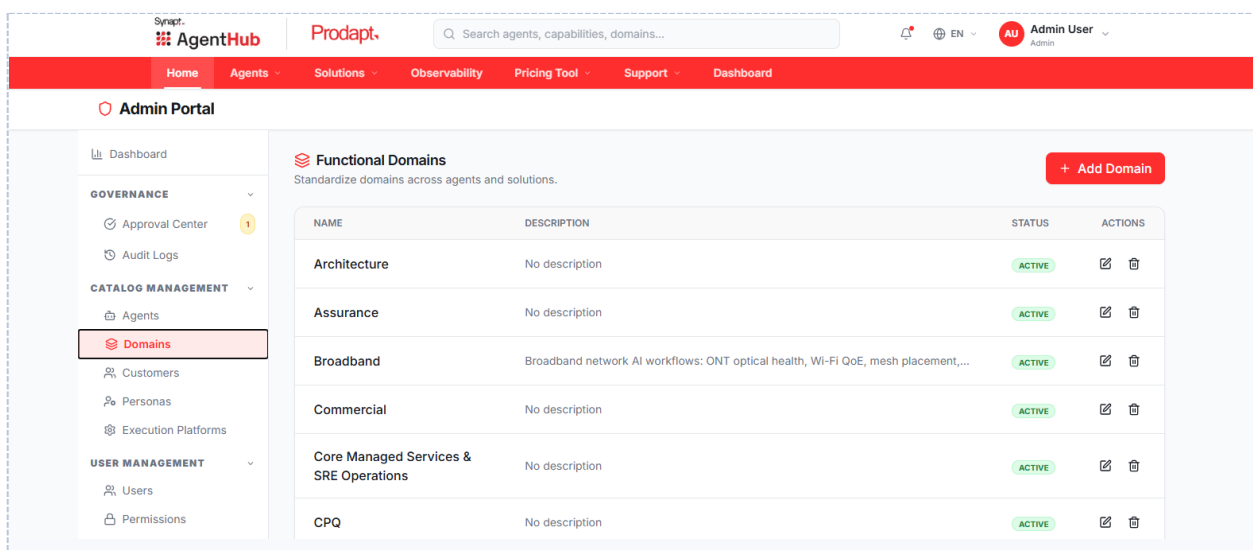

Figure: Metadata Management with Business Domains, Customers, Personas, Platforms

6.2 Role Management

AVAILABLE NOW Enhancements are in the roadmap

Role Management defines the roles in the platform and manages their permissions on capabilities. Standard roles include Admin, Sales, User, Developer, Reviewer, and Approver. Permissions determine which capabilities and actions each role can access, which is how the Reviewer and Approver separation in the Governance Lifecycle is enforced.

- Define roles: Admin, Sales, User, Developer, Reviewer, Approver, and custom roles
- Manage per-role permissions on capabilities

User Management
Manage users and assign roles

USER	ROLE	STATUS	CHANGE ROLE	ACTIONS
AD Admin User admin@agenthub.com	ADMIN	Active	Admin	Deactivate
AP Approver User approver@agenthub.com	APPROVER	Active	Approver	Deactivate
DE Developer User dev@agenthub.com	DEVELOPER	Active	Developer	Deactivate
RE Regular User user@agenthub.com	USER	Active	User	Deactivate
RE Reviewer User reviewer@agenthub.com	REVIEWER	Active	Reviewer	Deactivate
SA Sales User sales@agenthub.com	USER	Active	User	Deactivate

Figure: Role Management with permission matrix

6.3 User-group Management

AVAILABLE NOW Enhancements are in the roadmap

User-group Management defines user groups, binds individual users into groups, and links each group to one or many roles. Groups are the scaling mechanism for access control: administering membership and role linkage at the group level instead of user by user.

- Create user groups and manage membership
- Link a group to one or many roles

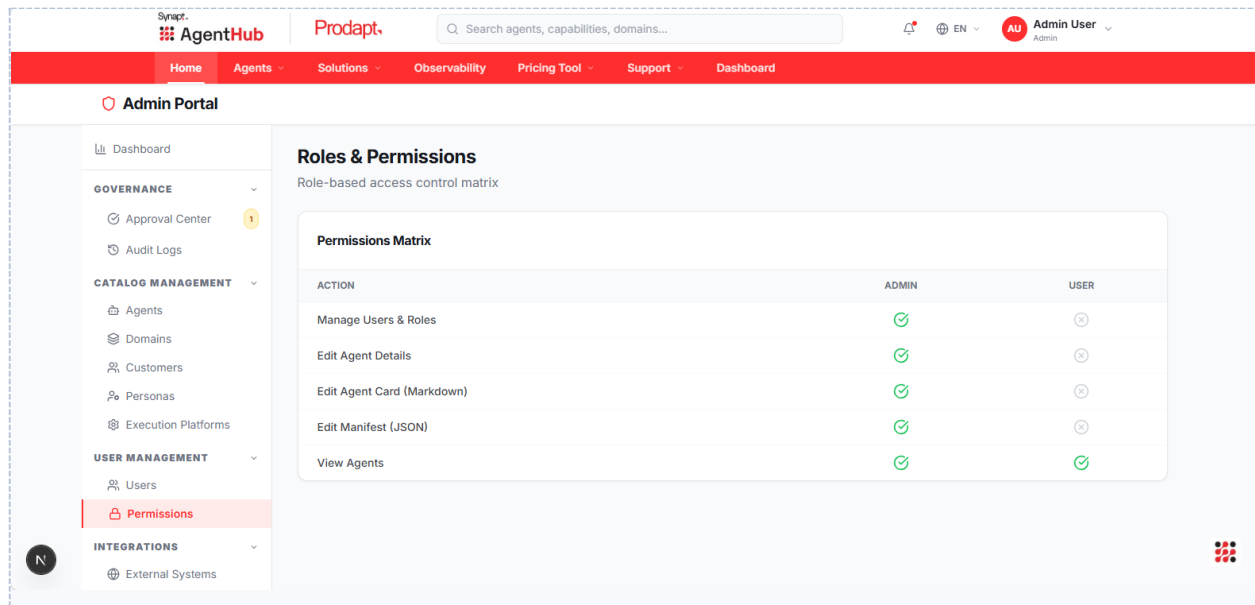

Figure: Permissions Management for various Roles

6.4 User Management

AVAILABLE NOW Enhancements are in the roadmap

User Management handles onboarding of users into AgentHub, including the approval step. New users are onboarded and approved before gaining access, and administrators manage the user base from this function.

- Onboard new users
- Approve pending user requests

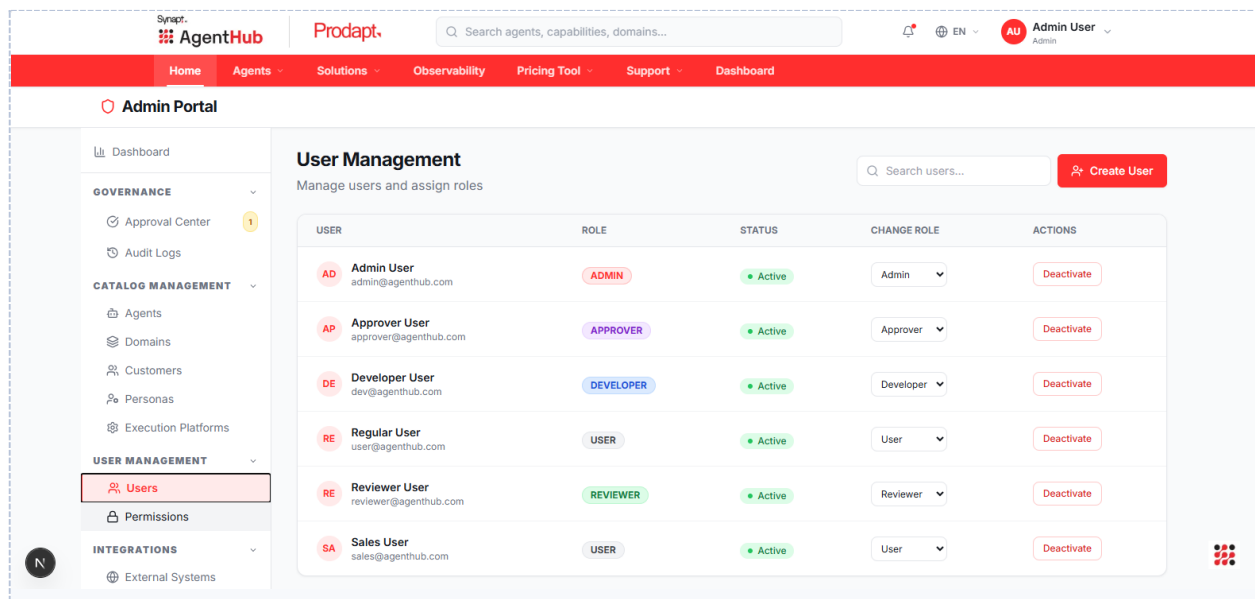

Figure: User Management with onboarding and approvals

6.5 Brand Management

PARTIALLY AVAILABLE Japanese supported in addition to English; further languages prioritized by customer need

Brand Management transforms the AgentHub brand color, logo, and language to match customer needs, enabling customer-specific white labeling of the platform. Japanese is currently supported in addition to English; other major languages will be prioritized based on customer need.

- Configure brand colors and logo per customer
- Select platform language (English and Japanese today)

The screenshot displays the 'Customer Branding' interface in the AgentHub Admin console. The top navigation bar includes the AgentHub logo, a SoftBank logo, a search bar, and user information (Admin User). The main content area is titled 'Customer Branding' with a subtitle 'Configure customer logos and brand colors applied across the platform.' The interface is divided into two main sections: 'Brand Identity' and 'Saved Profiles'.

Brand Identity

- QUICK PRESETS:** A row of buttons for 'Default (AgentHub)', 'Rogers', 'AT&T', 'SoftBank', 'TELUS', and 'Verizon'.
- CUSTOMER NAME:** A text input field with the placeholder 'e.g. Rogers Communications'.
- PRIMARY:** A color selection area with a red swatch and the hex code '#800000'.
- SECONDARY:** A color selection area with a red swatch and the hex code '#600000'.
- HIGHLIGHT:** A color selection area with a red swatch and the hex code '#800000'.
- DEFAULT LANGUAGE:** Two buttons: 'English' and 'Japanese (日本語)'.
- CUSTOMER LOGO:** A section for uploading a customer logo.

Saved Profiles

8 total

- SoftBank:** Status: ACTIVE. Colors: #345454, #000000, #800000. Language: Japanese (日本語).
- TELUS:** Status: Inactive. Colors: #482860, #003366, #482860. Language: English.
- AT&T:** Status: Inactive. Colors: #00AEEF, #0077AA, #00AEEF. Language: English.

Figure: Brand Management with color, logo, and language settings

7. User Functions

User Functions provide every user with self-service management of their own account.

Feature	What it does	Availability
User Detail Management	Users view and maintain their own profile details from this function	Available Now
Password Management	Users change and manage their own passwords from this function	Available Now

7.1 User Detail Management

AVAILABLE NOW Enhancements are in the roadmap

Users view and maintain their own profile details from this function.

The screenshot displays the 'My Profile' page in the AgentHub interface. The page is titled 'My Profile' with a subtitle 'Manage your account information and security.' The profile card on the left shows a red circular avatar with 'AU', the name 'Admin User', a role badge 'ADMIN', the email 'admin@agenthub.com', and a 'Security Level: Enterprise' indicator. To the right, the 'Profile Details' section contains input fields for 'FULL NAME' (filled with 'Admin User') and 'EMAIL ADDRESS' (filled with 'admin@agenthub.com'). Below this, the 'Security' section features a 'CURRENT PASSWORD' field with the placeholder text 'Enter current password to make changes'. At the bottom of the security section, there are labels for 'NEW PASSWORD' and 'CONFIRM NEW PASSWORD'. The page is framed by a red top navigation bar with links to Home, Agents, Solutions, Observability, Pricing Tool, Support, and Dashboard. The top right corner shows the user's name 'Admin User' and a dropdown menu. A search bar is located at the top left of the main content area.

Figure: User profile detail page

7.2 Password Management

AVAILABLE NOW Enhancements are in the roadmap

Users change and manage their own passwords from this function.

The screenshot displays the AgentHub Admin User profile page. On the left, a user card for 'Admin User' (AU) shows the email 'admin@agenthub.com' and a 'Security Level: Enterprise'. The main content area is titled 'Profile Details' and contains two sections: 'Profile Details' and 'Security'. The 'Profile Details' section has input fields for 'FULL NAME' (Admin User) and 'EMAIL ADDRESS' (admin@agenthub.com). The 'Security' section has a 'CURRENT PASSWORD' field with a placeholder 'Enter current password to make changes', and 'NEW PASSWORD' and 'CONFIRM NEW PASSWORD' fields with a 'Min. 8 characters' requirement. A red 'Save Changes' button is at the bottom right.

Figure: Password change dialog

8. Support Functions

Support Functions provide users to understand the platform better using Wiki, interact with ChatBot and register service request.

Feature	What it does	Availability
AgentBot	Ask any questions to the AgentBot chatbot and it will answer on capabilities	Upcoming
Quick Tour	Walkthrough users to each and every capability of the platform	Upcoming
Wiki	User guide on capabilities, documentation and demo videos	Upcoming
Contact Us	Contact AgentHub team and register user requests	Upcoming

Appendix A. Availability Summary

The table below consolidates availability across all features described in this guide.

Capability	Feature	Availability
Agents	Catalog / Create / Update / Manifest / Tester	Available Now
Agents	Builder (SynaptAO, ServiceNow)	Available Now for supported platforms
Agents	Builder (Salesforce, Snowflake, GCP, AWS, Azure)	On Roadmap
Agents	Deployer (Docker to SynaptAO)	Available Now for supported platforms
Agents	Tester (additional capabilities and extensions)	On Roadmap
Agents	Deployer (additional platforms)	On Roadmap
Agents	Connectors (integrations with platforms and deployment)	On Roadmap
Agents	Manager (environment bindings)	On Roadmap
Solutions	Catalog / Create / Update / Manifest / Tester	Available Now
Solutions	Builder adapters (SynaptAO, ServiceNow, Salesforce, Snowflake)	On Roadmap (manual today)
Solutions	Tester / Deployer / Manager	On Roadmap
Governance	Lifecycle / Observability	Available Now
Governance	Policy (tiered routing, token budget, prompt caching)	On Roadmap
Pricing Tool	Dashboard / Configure / Quotation	Available Now
Admin Functions	Metadata / Roles / User-groups / Users	Available Now
Admin Functions	Brand Management (languages beyond English and Japanese)	On Roadmap
User Functions	User Details / Password	Available Now
Support Functions	AgentBot / Quick Tour / Wiki / Contact Us	On Roadmap

Appendix B. Glossary

Term	Definition
Agent Manifest	Platform-agnostic agent definition in YAML schema; the single contract from which builds and deployments derive
Solution Manifest	Platform-agnostic workflow definition in YAML schema
Agent Card	Human-readable summary of an agent for discovery and decision-making
BPMN	Business Process Model and Notation; the standard used to define Solutions workflows
Builder	Adapter layer transforming manifests into platform-specific packages
Deployer	Adapter layer deploying built packages onto supported platforms
Reviewer	Role that reviews proposed agent and workflow versions before approval
Approver	Admin role that approves reviewed versions for publication
SynaptAO	Prodapt agent runtime platform; first supported Builder and Deployer target
Single Pane of Glass	Consolidated dashboard view; used in the Pricing Tool for sales leaders
Industry Pack	Curated vertical offerings such as Telco NOC, Telco Plan & Build, or IT Ops
